100 Mpc EAGLE simulation

- ▶ obs. agree with models for $\log M_{\text{BH}} > 7.5$ -> all AGNs with these mass & $z \sim 5$ have broad H α line
- ▶ significant discrepancies around $\log M_{\text{BH}} = 6.5$ -> incomplete

eg: obscured and narrow-line AGN at same z with lower BH mass

What if there are missing samples or the mass is underestimate?
